次の英文を日本語に訳しなさい。

Residential segregation by race remains a salient feature of contemporary American cities. Indeed, African Americans were as segregated from whites in 1990 as they had been at the start of the twentieth century, and levels of segregation appear unaffected by rising socioeconomic status (Massey & Denton 1993). Although segregation appears to have modestly decreased between 1980 and 2000 (Logan et al. 2004), blacks (and to a lesser extent other minority groups) continue to experience patterns of residential placement markedly different from whites. The degree to which discrimination contributes to racial disparities in housing has been a major preoccupation of social scientists and federal housing agents (Charles 2003).

The vast majority of the work on discrimination in housing utilizes experimental audit data. For example, between 2000 and 2002 the Department of Housing and Urban Development conducted an extensive series of audits measuring housing discrimination against blacks, Latinos, Asians, and Native Americans, including nearly 5500 paired tests in nearly 30 metropolitan areas [see Turner et al. (2002), Turner & Ross (2003a); see also Hakken (1979), Feins & Bratt (1983), Yinger (1986), Roychoudhury & Goodman (1992, 1996) for additional, single-city audits of housing discrimination]. The study results reveal bias across multiple dimensions, with blacks experiencing consistent adverse treatment in roughly one in five housing searches and Hispanics experiencing consistent adverse treatment in roughly one out of four housing searches (both rental and sales).³ Measured discrimination took the form of less information offered about units, fewer opportunities to view units, and, in the case of home buyers, less assistance with financing and steering into less wealthy communities and neighborhoods with a higher proportion of minority residents.

(Devah Pager and Hana Shepherd, 2008, *The Sociology of Discrimination: Racial Discrimination in Employment, Housing, Credit, and Consumer Markets*)
